Appendix 4

**BRAKE TORQUE BUILD UP CHECK - ADJACENT AXLES**

Draw the following graph showing brake torque characteristics for the additional axle and adjacent axle. Please note:

- (a) Measurement of braking torque and line pressure (or pedal force) is necessary unless equivalent and acceptable documentary evidence is produced.
- (b) The use of a roller brake-test dynamometer is required to establish this relationship.
- (c) This graph is only required where the specifications of the brakes on the additional axle are different to those of an adjacent axle.
- (d) Alternative evidence shall be considered if no roller brake test dynamometer is available.
