

The world is changing fast.

Having access to reliable connectivity is essential to our way of life, now more than ever. And it's something every Australian deserves. No matter where they live or work.

That's why important improvements are constantly being made to our wireless telecommunications infrastructure. To make sure all Australians have access to the benefits of the modern, digital society we live in today.

Improvements to these facilities make it possible for people to work from home, businesses to operate, students to access online learning resources and for live streaming and entertainment such as online gaming platforms to perform at their best.

Schools and universities, hospitals, banks, public transport and emergency services all rely on fast, quality coverage to better serve their communities. And more importantly, wireless connectivity helps us to maintain vital connections with those we love.

That's why it's so important that telecommunications facilities are installed near the area they intend to serve, not only to ensure they provide the most effective coverage but also to enable the community to stay connected.

Digital connectivity is essential in today's world.

It's also reassuring to know that in Australia, the technology that underpins connectivity - electromagnetic energy or EME - is researched, regulated and safe.
