

Wireless services: an essential part of our digital world

Wireless communication enables digital equity and inclusion.

It is an essential part of our everyday lives. We cannot fully participate in modern society without it.

In homes, it improves access to online education, banking services, and entertainment. All these services are facilitated by telecommunications infrastructure in your local areas that enable you to access the technology from your device.

In healthcare, wireless communication enables remote access to medical services and advice.

On farms, wireless sensor technology monitors soil moisture to enhance yields while conserving water.

In Australia, electromagnetic energy (EME) from telecommunications is researched, regulated and safe. Find some of the benefits at eme.gov.au
